I. Introduction

Consumer-protection law is vital for ensuring that market-based economies work in the economic interest of consumers as well as businesses, and thus to the benefit of society as a whole. This is well understood.

Caveat emptor—“let the buyer beware”—may have made sense as the default risk allocation between buyer and seller in the village marketplaces of yore, in which transactions were relatively small, and buyers and sellers were likely to know and expect future dealings with each other. These features would naturally encourage traders to comply with community-generated and community-enforced norms of commercial fair dealing.¹ In these admittedly idealized markets, sellers who cheated would quickly be found out, and they would face high social and economic costs, in contrast to the social and economic costs sellers face in modern markets, where traders are more likely to be strangers engaged in one-off transactions. The idealized markets of yore also dealt mostly in physical goods, which allowed buyers the opportunity to examine the goods before purchase.

Modern markets, especially online markets, differ from the idealized village marketplace in significant ways. The scope and scale of most contemporary online markets, for example, make it unrealistic to hope that relational obligations or a shared sense of morality could fully counterbalance incentives to cheat. On a recent “Prime Day” sales event, for example, Amazon sold over 300 million items in 20 different international markets, with total sales exceeding \$12 billion.² We note these figures not to suggest that Amazon cheats customers, but rather to underscore the observation that, in light of its size, it would be unrealistic to think that Amazon would temper its behavior out of fear that a group of customers, unhappy with a particular product or misrepresentation, could sour a sufficient portion of its buyers (124 million Amazon Prime customers in the United States in 2019)³ and/or sellers (more than 1.1 million third-party sellers in the United States in 2019)⁴ such that those customers would

1. The origins and development of the law of trade secrets, for example, reveal the primacy of community-generated norms of fair dealing in ordering conduct and protecting participants in the markets of yore. Today, firms often invoke trade-secret law to enforce property-like interests in proprietary information in order to gain or maintain an advantage vis-à-vis their competitors. In its early iterations, by contrast, trade-secret law “was understood as regulating *social relations* in the commercial realm.” See Amy Kapczynski, *The Public History of Trade Secrets*, 55 U.C. DAVIS L. REV. 1367, 1386-87 (2022) (emphasis added). The “core wrong” addressed by trade secret law as it emerged and developed in the seventeenth and eighteenth centuries “was not the violation of an exclusive right, but a *relational* wrong.” See *id.* at 1388 (emphasis added). In this way, early trade-secret law relied on the social fabric that bound market participants together, as if in a close weave, to restrain dishonest conduct and enforce shared norms of “commercial morality.” See *id.* at 1389.

2. See Jessica Young, *Amazon’s Prime Day 2022 Sales Top \$12 Billion*, DIGIT. COM. 360 (July 14, 2022), <https://www.digitalcommerce360.com/article/amazon-prime-day-sales> [https://perma.cc/EK9W-QZLD]

3. Bradley T., *Amazon Statistics: The Key Numbers and Fun Facts*, AMZ SCOUT, <https://amzscout.net/blog/amazon-statistics/#NumberOfAmazonUsers> [https://perma.cc/RL4P-CJMD].

4. *Key Metrics of Amazon.com Marketplace Sellers in the United States in 2019*, STATISTA (Nov. 2019), <https://www.statista.com/statistics/1086637/amazoncom-3p-seller-metrics-usa> [https://perma.cc/4J4A-BKCX]

reduce their dealings with Amazon in numbers that would have a material effect on Amazon's revenue or income. Small-scale acts of cheating in such circumstances are simply unlikely to be penalized in a meaningful way.⁵

If the cost of cheating is low, as it is in many online markets, then the relative incentive to cheat is high. Such conditions, especially when combined with other features of online markets that distinguish them from other markets, call out for vigorous enforcement of strong consumer protections.⁶

This is not the first time that markets have undergone significant changes, and these changes often have generated legal and regulatory responses. Because new products, new services, and new methods for conducting transactions all create new opportunities for mischief and deception, old rules may need to be revamped to fit the dangers posed by new times. Lawmakers and regulators typically have responded to these shifts with new sets of rules that modify the background principle of caveat emptor in ways that are tailored to the specific new dangers at hand. In the United States, for example, Congress enacted the Federal Food, Drug, and Cosmetic Act of 1938 in response to an increase in industrialized production of these products and the resulting high rates of contamination and other dangers.⁷ Congress enacted the Dodd-Frank Wall Street Reform and Consumer Protection Act in 2010 to restrain excesses in the banking industry that disadvantaged vulnerable borrowers and contributed to the financial crisis of 2007-08 and the Great Recession.⁸

Just as industrialization of food and proliferation and securitization of sub-prime loans did in the past, the explosive growth of e-commerce and ad-supported platforms has substantially transformed the consumer experience and

5. Online reviews of buyers and sellers are the modern-day analogue to the face-to-face exchanges in which participants in the idealized village marketplaces enforced their shared norms. But online reviews are different than personal discussions, and online screeds that trash a seller or product are different than accusations barked out from a podium in a crowded public square. Consumers reading online reviews generally do not know the people who write the reviews, for example, and this allows fake reviews (a topic we address below) to flourish.

6. Certainly, there may be some online markets cohesive enough to make it sensible to rely on the strength of personal relations to protect against bad conduct. We imagine an online market for the purchase and sale of "Wholesome Products for LDS Families," might fit the bill. See *MormonMarket.com*, LINKEDIN, <https://www.linkedin.com/in/mormon-market-86322443> [<https://perma.cc/R99A-HN44>]. We expect such markets, however, to be few and far between.

7. Food, Drug, and Cosmetics Act, Pub. L. No. 75-717, 52 Stat. 1040 (1938) (codified as amended at 21 U.S.C. §§ 301-399i).

8. Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. No. 111-203, 124 Stat. 1376 (2010) (codified as amended in scattered titles). Individual states in the United States also have a history of responding to new products, services, and business practices with consumer protection legislation addressing a particular topic. The rise of the ad-sponsored digital platform and resulting insatiable hunger for personal data that feeds the digital advertising ecosystem, for example, has prompted efforts by several states to give residents some degree of control over the personal data they generate. California is one of these states; it enacted legislation in 2018 that established a right to demand data deletion and a right to prohibit their sale. See generally *California Consumer Privacy Act (CCPA)*, CAL. DEP'T JUST. (Feb. 15, 2023), <https://oag.ca.gov/privacy/ccpa> [<https://perma.cc/6XAN-LMHL>] (providing details on the California Consumer Privacy Act). Efforts by states in this regard are admirable, but they also contribute to the patchwork nature of consumer protections in the United States, where the protections consumers enjoy (which might find their source in federal or state positive law, state common law, federal or state regulation, or even county or municipal ordinances state) may vary significantly by geography.

Consumer Protection for Online Markets and Large Digital Platforms

the consumer-merchant relationship. This transformation has exposed new and different consumer vulnerabilities. Yet, apart from the European Union, which recently adopted the Digital Services Act,⁹ the United States and other jurisdictions have not undertaken systemic reviews of their consumer protection regimes to ensure they are fit for the challenges we see in online markets.

The failure to update consumer-protection law is concerning in part because we rely on it to advance a broad range of interests in addition the purely economic interests of market participants. The failure to update the law may undermine these goals as well.

Some of these goals are mentioned in a set of consumer-protection guidelines issued by the United Nations and updated periodically. These “Guidelines for Consumer Protection” outline eleven “legitimate needs.”¹⁰ Some of these consumer needs are traditional “economic” consumer needs, but several are not. They range from the practical (access to necessary goods, access to information sufficient to make informed choices) to the aspirational (protection of vulnerable groups, protection from hazards) to the inspirational (promotion of sustainable consumption, freedom to organize, global free flow of information) and back again to the quotidian (access to dispute resolution).¹¹

Sustainable consumption and the free flow of information may be worthy goals, but they are beyond the scope of this Article. Rather, we focus here on consumer needs that are closely tied to their *economic* interests. Nor do we discuss diffuse social or societal harms—for example in relation to mental health or democracy—that typically are associated with harmful online content delivered to consumers by social media or other platforms that participate in online markets. These issues are important as well, and consumer-protection law can and in some instances does protect against societal in addition to individual consumer harms. Similarly, we do not discuss whether the platforms that recommend and deliver that harmful content should be deemed to suffer from design defects or to be subject to strict liability when they cause harm (although we see no economic reason to treat physical products sold online differently, in

9. Council Regulation 2022/2065, arts. 25-33, 42, 2022 O.J. (L 277). The Digital Services Act “regulates the obligations of digital services that act as intermediaries in their role of connecting consumers with goods, services, and content. This includes online marketplaces amongst others. . . . It will give better protection to users and to fundamental rights online, establish a powerful transparency and accountability framework for online platforms and provide a single, uniform framework across the EU.” *Questions and Answers: Digital Services Act*, EUR. COMM’N (Nov. 14, 2022), https://ec.europa.eu/commission/presscorner/detail/en/QANDA_20_2348 [<https://perma.cc/3W9U-UR3W>].

10. See G.A. Res. 70/186, annex (Dec. 22, 2015) [hereinafter UN Guidelines].

11. U.S. consumers live under a patchwork of consumer protections that can vary significantly based on geography. The protections are based in public rights and in private rights, and the protections are expressed and enforced by way of a jumble of national, state, and local laws, regulations, and ordinances. There are elements of this amalgam that aim to meet all the consumer needs the UN identifies, with one significant exception. As discussed above, no U.S. jurisdiction to our understanding has expressly committed to providing a “level of protection for consumers using electronic commerce that is not less than that afforded in other forms of commerce,” as recommended in a 2015 addition to the UN Guidelines. See *id.* ¶ 5(j). There is no economic justification for failing to do so.

this regard, from purely digital ones sold nor bartered online).¹² These questions are not the focus of this Article either.

Our principal concern is protecting consumers' economic interests. We focus our attention, therefore, on online transactions between firms and consumers. This set of transactions includes those in which digital products are ostensibly provided for “free”—in other words, consumers pay a zero-cash price—but where consumers provide consideration in the form of data and attention, or a promise to provide data and attention.¹³

This Article provides economic perspective and policy thinking on these important questions just touched upon. It starts by discussing the economic rationale for consumer protection, including explaining its key role in protecting against market power and ensuring competitive markets that deliver good consumer outcomes. It goes on to highlight some key differences between online and offline markets, explains what concerns these differences are likely to create for consumers and regulators, and provides a menu of policy proposals for addressing these concerns.

Many of the proposals are intended to be applied to all online firms, both traders and platforms, but some are targeted at the largest online gatekeeper platforms. In providing an economic perspective, this Article does not endeavor to assess the extent to which these concerns are addressed by existing consumer protection legislation, not least because of variation in coverage across jurisdictions.

This Article presents a menu of regulatory and enforcement options—all flowing from basic economic principles—that would protect consumers and foster more efficient digital markets. Regulators and legislators might choose to enact some, but not all, of the solutions proposed here depending on the specifics of their regulatory regimes or their desire or mandate for intervention.

12. Advocates in the United States have deployed consumer protection to achieve what might traditionally be seen as social justice, as opposed to efficiency, goals. For example, several survivors of a “conversion therapy” program touted as capable of turning them from gay to straight successfully sued the service provider, arguing, among other things, that the services rendered were “unconscionable” in violation of New Jersey consumer-protection law. See Erik Eckholm, *In a First, New Jersey Jury Says Group Selling Gay Cure Committed Fraud*, N.Y. TIMES (June 26, 2015), <https://www.nytimes.com/2015/06/26/nyregion/new-jersey-jury-says-group-selling-gay-cure-committed-fraud.html> [<https://perma.cc/LD9U-NE65>]; *Ferguson v. Jonah*, No. L-5473-12, 2019 WL 5459860, at *1 (N.J. Super. Ct. June 10, 2019). Social justice and efficiency concerns are not wholly unrelated, however. Fiona M. Scott Morton and her coauthors, for example, explain that digital platforms can be addictive or otherwise harmful when they exploit behavioral biases and addiction related vulnerabilities, that they do this to extend their markets, and that output—which often is deemed a proxy for consumer welfare—cannot serve that analytical role if a product is addictive or harmful. Higher output of something that harms consumers (gambling websites, for example) is not always a good thing. James Niels Rosenquist, Fiona M. Scott Morton & Samuel L. Weinstein, *Addictive Technology and its Implications for Antitrust Enforcement*, 100 N.C. L. REV. 431, 432-41 (2022).

13. See Luigi Zingales & Filippo Maria Lancieri, *Policy Brief*, in STIGLER COMM. ON DIGIT. PLATFORMS: FINAL REP., STIGLER CTR. FOR THE STUDY OF THE ECON. & THE STATE 6, 8 (Sept. 2019), <https://www.chicagobooth.edu/-/media/research/stigler/pdfs/digital-platforms---committee-report---stigler-center.pdf> [<https://perma.cc/8VMS-7VKC>] (noting that in such markets, “only the monetary price consumers pay is zero. Consumers pay in kind, by transferring their data.”).

In a similar vein, each of this Article’s authors may not endorse every proposal we outline below. Nor is there consensus among the authors on which of the proposals are most important or most effective in protecting consumers and promoting efficiency. Nonetheless, all authors agree that each of the concerns and proposals identified herein is supported by sound, modern economic principles; we offer these proposals based on that consensus.

II. Core Tenets of Traditional Consumer-Protection Law

A. *The Economic Rationale for Consumer Protection*

In a market economy, it is well understood that we often rely on competition to deliver good outcomes for consumers. What is perhaps less well recognized is the crucial role that effective consumer protection plays in this process, both in facilitating competition and in ensuring that it is directed towards the interests of consumers.

In standard introductory-textbook treatment of markets, consumers know characteristics of the products available to them (various brands of whole, low-fat, or skim milk, for example), can rank these options in a coherent and consistent (“rational”) fashion according to their preferences, and select their preferred option from among those they can afford. Coupled with a competitive supply and other well-known conditions, such a textbook market generates desirable consumer outcomes in the sense that it is infeasible to make a consumer better off without making someone else worse off.

Even in such an ideal environment, firms have an incentive to limit competition (through cartel behavior, mergers, and monopolization) to increase their profits. Competition policy is designed to protect against such supply-side anticompetitive tactics. By protecting competition, competition enforcement is intended to generate positive consumer outcomes.

In practice, however, this is only true if certain assumptions hold. At a simple level, firms must not be engaging in naked fraud—that is, the product they sell must both exist and be what it claims to be. In simple terms, if consumers are unable to distinguish between honest traders and fraudsters, then competition will not deliver good outcomes. Indeed, the incentives of traders to remain honest in a competitive market will be weak, and there is a serious risk that only the fraudsters will survive.¹⁴

It is well understood that consumer protection has a critical role to play in protecting against such bad market outcomes by preventing fraud, and more

14. See PAOLO SICILIANI, CHRISTINE RIEFA & HARRITET GAMPER, CONSUMER THEORIES OF HARM: AN ECONOMIC APPROACH TO CONSUMER LAW ENFORCEMENT AND POLICY MAKING 119, 120 (2019) (discussing the risk of an “[a]dverse [s]election’ [s]piral” in which the presence of “unfair firms making misleading quality claims” leads all fair firms offering high quality products to exit).

generally by providing a level playing field so that firms cannot gain market advantage by offering consumers a bad deal.¹⁵

Consumer protection also has a more sophisticated role to play, though, even in the absence of all-out fraud. Many of the ideal assumptions set out above do not reflect important aspects of consumer behavior, and this has important implications for competition.¹⁶ Simply put, even with a competitive supply side, markets most effectively deliver good consumer outcomes if consumers make well-informed active choices to buy the products that best suit their needs. This in turn requires them to engage with the market in question in order to *access* relevant information about available products, *assess* that information, and then *act* on that information. These three “A’s” underpin effective consumer decision making.¹⁷

In practice, real consumers have limited information as well as a limited ability to process information; they face search and switching costs; they have cognitive limitations; and they exhibit behavioral biases.¹⁸ They make decisions based on imperfect information; their ranking of options may not be coherent or consistent; and they may fail to select their preferred option (either by mistake or because of misdirection by the seller). In addition, evidence on consumer inertia suggests that consumers procrastinate, either on account of (partially naïve) time-inconsistent preferences, overoptimism regarding future memory, or underestimation of future switching costs. They may simply lack self-control or forget to complete the process of finding better suppliers.¹⁹

15. Several chroniclers of Facebook’s rise to monopoly have observed that Facebook engaged in this precise strategy. Before Facebook became dominant, it promised its users strong privacy protections but in fact was building and deploying an extensive tracking program. By contrast, its competitors were keeping their similar promises. Facebook covertly used the data it collected to gain market share to the point that the market began to tip. It was at that point that Facebook formally reneged on its privacy promises and required users to consent to tracking. See Fiona M. Scott Morton & David C. Dinielli, *Roadmap for an Antitrust Case Against Facebook*, OMIDYAR NETWORK 2 (June 2020), <https://www.omidyar.com/wp-content/uploads/2020/06/Roadmap-for-an-Antitrust-Case-Against-Facebook.pdf> [<https://perma.cc/AQ6W-G5MK>]; Dina Srinivasan, *The Antitrust Case Against Facebook: A Monopolist’s Journey Towards Pervasive Surveillance in Spite of Consumers’ Preference for Privacy*, 16 BERKELEY BUS. L.J. 39, 87 n. 247 (2019).

16. Our current understanding of the ways in which actual markets differ from “ideal” markets has developed over several decades. An important part of that debate has been the development of a substantial body of behavioral economics research, which includes theoretical work as well as laboratory and field studies. That body of work has advanced our knowledge of “real” consumers and how they differ from ideal ones.

17. Amelia Fletcher, *Disclosure As a Tool for Enhancing Consumer Engagement and Competition*, 5 BEHAV. PUB. POL’Y 252, 255-56 (2021).

18. See generally Michael D. Grubb, *Behavioral Consumers in Industrial Organization: An Overview*, 47 REV. INDUS. ORG. 247, 247-255 (2015) (reviewing industrial organization literature on cognitive biases of consumers).

19. When ignoring behavioral and attentional constraints, switching costs can explain the prevalence of consumer inertia. Estimates of the necessary switching costs when ignoring behavioral and attentional constraints, however, are often implausibly large. For instance, Benjamin Handel concludes that U.S. consumers in his sample lose about \$2000 annually from not changing to a better health insurance plan. Benjamin R. Handel, *Adverse Selection and Inertia in Health Insurance Markets: When Nudging Hurts*, 103 AM. ECON. REV. 2643, 2667 (2013) (“The mean total money left on the table per employee due to inertia is \$2,032 . . .”).

Consumer Protection for Online Markets and Large Digital Platforms

These various factors limit the effectiveness with which consumers both engage with the market in the first place and then *access*, *assess*, and *act* on relevant information, and this in turn affects market outcomes. Even “competitive” markets can generate poor consumer outcomes when consumers do not move to choices that provide lower prices, higher quality, or less exploitation. If consumers, for example, ignore an aspect of the product or its price, even competitive firms will exploit this by choosing the neglected dimension to maximize profits.²⁰ Similarly, when consumers mispredict future usage—such as being overly optimistic regarding future gym attendance—firms write contracts to benefit from the consumers’ mispredictions of their own behavior.²¹

Unregulated profit-maximizing firms in such settings—knowingly or unknowingly—exploit naïve consumer misperceptions, and this can lead to undesirable distributional consequences as well as a variety of inefficiencies.²² When consumer protection effectively limits the ability of firms to exploit such misperceptions, it can thus lead to more desirable market outcomes.

Furthermore, firms may have an incentive to impede informed consumer decision making to exacerbate these issues. For example, firms that do not offer the best deal in the marketplace have a heightened incentive to make product

20. See Xavier Gabaix & David Laibson, *Shrouded Attributes, Consumer Myopia, and Information Suppression in Competitive Markets*, 121 *ECON. J.Q.* 505 (2006) (showing how firms may shroud product information even in “highly competitive markets” where some consumers are “myopic” or “unaware”).

21. Stefano DellaVigna & Ulrike Malmendier, *Paying Not to Go to the Gym*, 96 *AM. ECON. REV.* 694, 694-96 (2006). Academic studies have established that consumers engage in misperception of firms’ offers or misprediction of their own future use of firms’ service in a variety of markets and investigated how firms respond to such behavior. Consumer misperception, and the resulting consumer behavior, has been observed and documented in connection with gym contracts, magazine subscriptions, mobile phone contracts, and banking contracts as they relate to overdraft fees. See generally Sharon Oster & Fiona Scott Morton, *Behavior Biases Meet the Market: The Case of Magazine Subscription Prices*, 5 *ADVANCES IN ECON. ANALYSIS & POL’Y* 1 (2005) (magazine subscriptions); Michael D. Grubb, *Selling to Overconfident Consumers*, 99 *AM. ECON. REV.* 1770 (2009) (mobile phone contracts); Michael D. Grubb & Matthew Osborne, *Cellular Service Demand: Biased Beliefs, Learning and Bill Shock*, 105 *AM. ECON. REV.* 234 (2015) (mobile phone contracts); Sule Alan, Mehmet Cemalcilar, Dean Karlan & Jonathan Zinman, *Unshrouding: Evidence from Bank Overdrafts in Turkey*, 73 *J. FIN.* 481 (2018) (banking contracts).

22. Mark Armstrong & John Vickers, *Consumer Protection and Contingent Charges*, 50 *J. ECON. LIT.* 477, 477 (2012); see, e.g., Paul Heidhues & Botond Köszegi, *Behavioral Industrial Organization*, in 1 *HANDBOOK OF BEHAVIORAL ECONOMICS: FOUNDATIONS AND APPLICATIONS* 517, 530-539 (B. Douglas Bernheim, Stefano DellaVigna & David Laibson eds., 2018) (discussing participation distortions, exploitation distortions, as well as follow-on distortions). Participation distortions result if the consumer misestimates either the total price they will pay for the product or the value of the product. In that case, they may participate in the market even though the value of product is below its costs. Exploitation distortions arise when firms write contracts that are good at exploiting consumers’ behavioral or attentional bias but lead to inefficient usage decisions. If consumers underestimate the importance of add-on prices when buying a base product, for example, firms will offer seemingly attractive deals with high add-on prices and low base prices. The high add-on price will induce consumers to inefficiently withhold add-on demand, leading to inefficient usage and thereby to an exploitation distortion. When the exploitation of consumer bias is profitable, a number of follow-on distortions can arise, including excess market entry to benefit from these profits, see Paul Heidhues, Botond Köszegi & Takeshi Murooka, *Inferior Products and Profitable Deception*, 84 *REV. ECON. STUD.* 323, 323-24 (2017); or firms spending money on inventing new ways to exploit consumer biases, see Paul Heidhues & Botond Köszegi, *Naïveté-Based Discrimination*, 132 *ECON. J.Q.* 1019, 1019-28 (2016).

comparisons hard and generate consumer confusion. The inability of consumers to compare products can be a source of profits and oligopoly power, even when there are several suppliers.²³ And when markets become more competitive, firms can have incentives (unilateral or shared) to make product comparisons difficult, or otherwise obfuscate, in order to avoid the resulting downward pressure on profit margins.²⁴ Consumer protection that makes it harder to obfuscate can thus increase the competitiveness of the marketplace to the benefit of consumers.

In the above examples, competition itself is dampened, and market power increased, when consumers make poor choices. In simple terms, if consumers don't search and switch readily to better product offerings, then firms' incentives to offer better deals will be reduced, and it is these incentives that underpin effective competition. Likewise, an established firm will have more market power, and greater incumbency advantage, if it is unlikely to lose its customers to rivals even if the latter offer a theoretically more attractive deal.

Consumer protection can achieve more desirable market outcomes by mandating disclosure of information to consumers on a clear and prominent basis, thereby increasing their engagement.²⁵ Importantly, however, it can be both rational and efficient for consumers to choose not to fully inform themselves. If a consumer were always to scrutinize all the terms and conditions of the services for which they signed up, they would have little time to do anything else; they instead tend to "click to accept" without giving this "small print" any serious scrutiny.²⁶

Regulators can help consumers save time and effort with legislation that protects against unsafe or unfair outcomes. For example, a U.S. consumer who purchases food in a supermarket is not expected to carefully check whether the available food is toxic; they can trust in the ingredient list, the nutrition label, the volume or weight measures, and food-safety regulations to protect them from the worst choices.

23. Tibor Scitovsky, *Ignorance as a Source of Oligopoly Power*, 40 AM. ECON. REV. 48, 48-53 (1950); see also Peter Diamond, *A Model of Price Adjustment*, 3 J. ECON. THEORY 156, 156-68 (1971) (modeling impacts of consumer behavior on pricing).

24. Ran Spiegler, *Competition Over Agents with Boundedly Rational Expectations*, 1 THEORETICAL ECON. 207, 207, 210 (2006); Ioana Chioveanu & Jidong Zhou, *Price Competition with Consumer Confusion*, 59 MGMT. SCI. 2450, 2450 (2013); see also Bruce Carlin, *Strategic Price Complexity in Retail Financial Markets*, 91 J. FIN. ECON. 278, 284 (2009) (developing a model accounting for such obfuscation).

25. Strictly speaking, there may be circumstances in which distortions in consumer behavior can improve market outcomes, because they counterbalance other factors—such as informational problems—which drive competitive markets to deliver poor outcomes. For example, Handel estimates that if U.S. consumers were to select health insurance plans optimally, the welfare loss from adverse selection effects would double. But even in these cases, rather than relying on consumer confusion and mistakes, regulators should address the underlying adverse-selection problem directly. Handel, *supra* note 19.

26. One study reviewed the extent to which potential buyers accessed the end-user license agreements of 90 online software companies. They found that "only one or two of every 1,000 retail software shoppers access the license agreement and that most of those who do access it read no more than a small portion." Yannis Bakos, Florencia Marotta-Wurgler & David R. Trossen, *Does Anyone Read the Fine Print? Consumer Attention to Standard-Form Contracts*, 43 J. LEGAL STUD. 1, 1 (2014).

Consumer Protection for Online Markets and Large Digital Platforms

When consumers are protected in this way from “hidden nasties,” they can focus their scarce attention on the salient aspects of the product (e.g., exactly how much sugar) that are likely to result in better choices. Moreover, with such protections, consumers are more likely to have the confidence to try new products or suppliers. Without them, they may be more inclined to buy from established incumbent sellers who may be no better than entrants, but who have earned consumer trust by selling in previous periods. This can clearly increase the market power of such suppliers. Competition can thus be improved by consumer-protection law that allows consumers to choose safely between products, including from less well-established sellers, secure in the knowledge that a mistaken choice will not have significant adverse consequences.²⁷

Consumer-protection law also can help limit a firm’s ability to leverage its position in its core market into new markets. Where a firm has an existing customer relationship, it has a natural advantage in selling additional products to that customer. However, it can potentially unfairly exploit its advantageous position through selling additional products on a misleading basis. For example, the UK Advertising Standards Authority recently upheld a complaint against Amazon in relation to its advertising of its Amazon Prime service, which is additional or complementary to its core online shopping service.²⁸ By misleading consumers into subscribing to Prime, Amazon was effectively leveraging its core market position into this additional service, conduct that raises concerns both about Amazon’s market power (an “antitrust” concern) and its marketing methods (a “consumer protection” concern).

B. The Role of Consumer-Protection Law in the Market

The above discussion demonstrates that firms can benefit from these consumer limitations and can have an incentive to exacerbate them—for example, through deliberate obfuscation and misleading sales practices. Consumer-protection law can help to ameliorate such problems, and thus has a key role to play in limiting market power and ensuring that competition works to the benefit of consumers. As such, effective consumer protection can be seen as a key component of effective competition policy and, therefore, a natural and central concern of economists.

In enhancing the functioning of markets, consumer-protection law plays three core roles.

First, consumer-protection law *facilitates consumer choice*²⁹—for example, by mandating disclosure, mandating measures that aid easy product comparison,

27. See, e.g., Paul Heidhues, Johannes Johnen & Botond Köszegi, *Browsing Versus Studying: A Pro-Market Case for Regulation*, 88 REV. ECON. STUD. 708, 708-11 (2021).

28. See *ASA Ruling on Amazon Europe Core Sarl*, ADVERT. STANDARDS AUTH. (Oct. 30, 2019), <https://www.asa.org.uk/rulings/amazon-europe-core-sarl-G19-1021643.html> [<https://perma.cc/99DJ-BVNJ>].

29. Consumer choice can relate to whether to buy at all, how much/often to buy, and which product to buy.

restricting misleading sales practices, or ensuring that consumers are not unduly inhibited from switching suppliers. Examples include:

- requirements to use standard measurements that facilitate comparing product amounts and effective prices;
- requirements to disclose certain key information prior to purchase, such as the identity of the trader, the main characteristics of the product, and the total price payable;
- requirements not to engage in false, misleading, or aggressive sales practices;
- requirements not to lock in consumers by making it unduly difficult or costly to switch.

Second, consumer-protection law comes into play where it proves unrealistic to expect consumers to protect themselves simply by making good and informed choices on all aspects of what they are buying. In such cases consumer-protection law acts to *protect consumers from exploitation* more directly, as well as enhances their confidence to engage in markets. Existing examples include:

- safety regulations that protect consumers from unsafe products, whether appliances, food, or pharmaceuticals;³⁰
- fiduciary duties for financial advisors to act in their clients' best interest when (effectively) making decisions on their behalf;
- standardized contract terms for certain products (and more general unfair contract principles for standard business-to-consumer contracts) to ensure that firms cannot hide unfair terms and conditions in the fine print.

Third, consumer-protection law codifies substantive *standards and procedures for dispute resolution* for when things go wrong—for example, in relation to rights of return, refunds, or repair.

Another useful distinction, when discussing consumer-protection law is the distinction between its more general *preventative* role, protecting against harmful firm conduct, and its *market design* role, facilitating or creating tools which are intended to enhance consumer decision making. Preventative law is more likely to be defined in broad terms and to apply across firms and sectors, while market-design measures tend to be more precise and sector specific. An example of the latter would be the requirement that credit companies disclose their cost of credit in a specific format (e.g., large font annual percentage rates) that is designed to facilitate consumer understanding and comparison across products.

The above discussion focuses on the economic rationale for consumer protection, but political and fairness considerations also play an important

30. Note that in this situation, the regulator directly removes choices from the market because they are too harmful to too many consumers.

motivating role. Fairness can relate to the transaction process itself: Was the consumer in a position to make a free and well-informed choice? Or it can relate to the substantive outcomes of that process: Do consumers get a fair deal relative to sellers, or relative to other consumers? There is broader consensus about the benefits of intervening to protect the former (fair process) than the latter (fair outcomes), but consumer-protection law tends to address both in practice, partly because both are well aligned with the economic basis for consumer protection.

Of course, consumer-protection law is not always beneficial. Mandating disclosure of relevant information will not improve consumer choice if consumers simply ignore it, and it could even harm consumer decision making if consumers feel overloaded. Likewise, simplified disclosure can be distortionary if the simplification is ill-suited to the choice being made. Consumer-protection law can also be detrimental if, in protecting the naïve, it inhibits firms from offering products that more sophisticated consumers would both understand and value.

The fact that certain protections can have some negative consequences does not undermine the general need for, and benefits of, consumer-protection law; rather, the observation simply demonstrates that regulation of this sort often involves trade-offs. The discussion above provides ample examples of conduct that should be regulated and why we cannot rely on the principle of *caveat emptor* (buyer beware). Nonetheless, potential negative consequences should clearly be considered carefully in regulatory design.

III. Consumer-Protection Law for Online Markets

This Article asks whether, and if so, what refinements of consumer-protection law are needed in online markets to help ensure that these markets work as much as possible in the interest of consumers.

Of course, many of the consumer-protection issues we observe online have analogs in an offline environment. Fraud, obfuscation, and misleading sales behavior are age-old practices, and offline firms are well-versed in trying to persuade consumers to purchase through a variety of activities, including the design of their stores, special offers, and different psychological sales techniques.

As a result, there is already an extensive legal framework for consumer protection in place. This Article does not aim to provide a legal assessment of that existing framework, but rather to highlight—in economic terms—what is different in an online environment, the implications for consumer decision making, and how this might be expected to change the consumer-protection law that is required.

In taking an economic approach to our analysis, we have not sought to identify whether the issues we highlight imply real gaps in the law. Indeed, it may be that the existing legal framework can address several of the issues that we discuss below. In the United States, Section 5(a) of the Federal Trade Commission (FTC) Act imposes a general prohibition on “unfair or deceptive

acts or practices in or affecting commerce.”³¹ Likewise, in the EU, the Unfair Commercial Practices Directive 2005 generally prohibits “[m]isleading commercial practices” or “unfair commercial practices” that are “contrary to the requirements of professional diligence,”³² while the EU Unfair Contract Terms Directive 1993 provides general protection for consumers against unfair terms in standard contracts.³³

Many of the practices highlighted below are likely to be covered by these general regulations or laws (or by common law principles in the United States and the United Kingdom). Any ambiguity in this regard may potentially be resolved by clarifications, minor amendments, or new guidelines. There are, however, some new concerns arising that are more likely to suggest a need for more substantial additions or changes to consumer-protection law. In particular, although much of the discussion below applies to all online markets, we identify a number of regulations that are specifically intended for the largest online platforms.

We see four main reasons for the differential treatment of these largest online platforms.

First, as critical gatekeepers between business users and consumers, these platforms are in a unique position to change the way in which markets function by setting and enforcing platform rules that apply to their business users. They have access to relevant data and algorithmic-design skills that enable more highly automated monitoring and policing of harmful online activity than any third-party regulator could achieve. Their massive scale means that even small changes to enhance consumer protection could benefit millions of consumers.

Second, these platforms have immense access to consumer data, and are skilled in deploying machine learning algorithms to mine these data for relevant behavioral patterns and using A/B testing techniques that effectively industrialize trial and error experimentation to maximize user impact.³⁴ This advantages them, in particular, as compared to smaller firms with less access to data, in refining their design choices to best influence consumer behavior, whether this be for good or ill.

31. 15 U.S.C. § 45(a) (2018).

32. Council Directive 2005/29, ch. 2, art. 5-6, 2005 O.J. (L 148).

33. Council Directive 93/13, 1993 O.J. (L 95). Currently, the EU consumer law generally still applies in the United Kingdom too. Lorraine Conway, *Briefing Paper No. 9126*, HOUSE OF COMMONS LIBRARY 13 (May 2021) (“Since 1 January 2021, UK consumers have continued to enjoy similar consumer rights as they did before Brexit.”). However, this need not remain the case in future, following the withdrawal of the United Kingdom from the European Union.

34. “A/B testing” refers to the process of comparing two versions of something to see which version performs better. As an example, a website designer might want to test two versions of a “subscribe button,” a small version and a large version. The designer might show the different subscribe buttons to different groups of site visitors and measure which button gets more clicks. A/B testing is not unique to websites or other online settings but has become an especially commonplace tool to assist the design of various online experiences. See Amy Gallo, *A Refresher on A/B Testing*, HARV. BUS. REV. (June 28, 2017), <https://hbr.org/2017/06/a-refresher-on-ab-testing> [<https://perma.cc/XQT8-7PJY>]. See also RON KOHAVI ET AL., TRUSTWORTHY ONLINE CONTROLLED EXPERIMENTS: A PRACTICAL GUIDE TO A/B TESTING (2020).

Consumer Protection for Online Markets and Large Digital Platforms

Third, as highlighted above, weak consumer protection can contribute to creating and enhancing market power. Such competition implications are especially problematic in the context of the largest online platforms, given the competition concerns highlighted by numerous recent reports,³⁵ and the array of other factors tending to impede competition in these markets.³⁶

Fourth, a key rationale for consumer-protection law is the imbalance in power between a firm and its consumers. At the same time, in designing such law, there is always a balance to strike between protecting consumers and imposing burdens on businesses. Since many small firms have only limited resources and a limited power imbalance relative to their consumers, any universally applicable legislation will tend to strike this balance by conferring less protection on consumers than would be ideal. In stark contrast, the largest online platforms are huge and benefit from substantial economies of scale, the imbalance in power between these platforms and individual consumers is dramatic, and the benefits of enhanced consumer protection are likely to massively outweigh any additional burden on these platforms. This combination merits stronger regulation than could be justified on a universally applicable basis.

C. Key Differences Between Online and Offline Consumer Choice, and Their Implications

In some ways, consumer decision making is easier in an online environment. Finding relevant information about a wide range of products involves a lot less shoe-leather and time than it did in an offline environment; indeed, consumers can access new products and sellers that simply would not have been available in their local stores. Consumers are also aided in their choices by a wide range of tools, such as specialist search sites and access to reviews and ratings from past consumers. These new tools have the potential to improve both consumer and competition outcomes, so long as they work in ways that genuinely enhance consumer decision making.

The differences between the online and offline environments, however, can also create additional concerns for consumers. In general terms, the online environment allows consumers to compare products and traders more easily

35. See, e.g., Mkt. Structure & Antitrust Subcomm., *Report*, in STIGLER COMM. ON DIGIT. PLATFORMS: FINAL REP., STIGLER CTR. FOR THE STUDY OF THE ECON. & THE STATE 23, 29-31 (Sept. 2019), <https://www.chicagobooth.edu/-/media/research/stigler/pdfs/digital-platforms---committee-report---stigler-center.pdf> [<https://perma.cc/8VMS-7VKC>]; Jacques Crémer, Yves-Alexandre de Montjoye & Heike Schweitzer, *Final Report on Competition Policy for the Digital Era*, EUR. COMM'N 19-24 (2019), <https://ec.europa.eu/competition/publications/reports/kd0419345enn.pdf> [<https://perma.cc/5AQ2-KT76>]; Jason Furman, Diane Coyle, Amelia Fletcher, Derek McAuley & Philip Marsden, *Unlocking Digital Competition: Report of the Digital Competition Expert Panel*, DIGIT. COMPETITION EXPERT PANEL 54-56 (Mar. 2019), https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/785547/unlocking_digital_competition_furman_review_web.pdf [<https://perma.cc/5485-ULZF>].

36. Of course, regulation of small firms also can help check the power of large firms by enhancing consumer trust in the products and services offered by the small firms. This in turn increases the likelihood that consumers will switch their purchases from the large to the small firms.

(consumers can “click” their way from store to store, for example, rather than walking or driving between them). But this feature of the online environment can in turn give firms incentives to obfuscate price or other features of their offerings to make comparisons more difficult. Obfuscation of this sort creates consumer protection concerns and limits some of the benefits that the internet can bring.³⁷ However, there are also more specific differentiating factors between online and offline markets. In each of the sections below, we highlight one of these, explain the concerns that arise, and set out how consumer protections might need to be modernized to address them.³⁸

In doing so, we provide a menu of specific policy proposals. Several of these would be suitable for all online firms, whether platforms or traders. However, for the reasons set out above, we also set out a number of proposals that are targeted at the largest online platforms.

The menu is provided in the spirit of “letting a thousand flowers bloom.” They are not inconsistent, but they are also not intended as an “all-or-nothing” package. Many would be valuable even if others were not adopted. All proposals are supported by at least one of the Article’s authors, but not all the authors fully support every proposal. In some cases, there is greater support for a prohibition if provided for on a “rebuttable-presumption” basis, which would allow the firm a right of defense before penalties or other consequences are imposed.

As discussed above, in some cases, the proposals might already be addressed by overarching principle-based laws. Where this is true, relevant proposals might instead provide useful guidance for interpreting such prohibitions. In several places, we identify safeguards needed to make online sales comparable to offline sales. We note, however, that offline sales also have significant imperfections. As such we do not restrict our recommendations to those required to achieve parity between these routes to market, but more generally focus on helping consumers and improving outcomes from online interactions.

D. Transactional Transparency

1. Lack of Direct Physical Interaction with the Trader, and Need for Access to Contact Details, Rights of Return, and Dispute Resolution

Perhaps the most obvious difference between offline and online is that the consumer has no physical interaction with the trader or the product (if it is a physical product). This can mean that the consumer, in many instances, has no idea who the trader really is or where they really are, they have no ability to try

37. See Glenn Ellison & Sara Fisher Ellison, *Search, Obfuscation and Price Elasticities on the Internet*, 77 *ECONOMETRICA* 427, 427 (2009) (“A primary observation is that the effect of the Internet on search frictions is not so clear-cut: advances in search technology are accompanied by investments by firms in obfuscation.”).

38. Of course, there may also be areas of consumer protection legislation that become less important with the move to online commerce. We have not attempted to identify these in this Article.

Consumer Protection for Online Markets and Large Digital Platforms

on a product or check whether it is right for their particular needs, and they have no ability to march into the store and ask for the manager if they are unhappy with the service they have received.³⁹

Specific Policy Proposals

Consumer-protection law can improve this situation in some very basic ways. Online traders should be required:⁴⁰

- to provide valid and standardized contact details, including geographical address, phone number, and email address (or contact form) if such information is not already clear from the context;
 - to set out clearly and prominently before purchase (i) the main characteristics of the goods or services and (ii) the total price of the goods or services, inclusive of taxes and delivery charges (or if the nature of the goods or services is such that the price cannot reasonably be calculated in advance, the manner in which the price is to be calculated);
 - to offer a “no fault” right of return for products—under certain conditions and within a reasonable time frame—which do not turn out to suit the consumers’ needs;
 - to set out clearly the process consumers should follow in case of complaints, and to deal with these fairly; and
 - to sign up with an online dispute resolution scheme at no or at minimal cost to the consumer (in order to address complaints that are not resolved).
2. Lack of Clear Labeling of Advertising or Clear Demarcation Between Advertising and Organic (or Editorial) Content

In an offline context, consumer-protection law typically requires that advertising and marketing be clearly flagged as such and clearly separated from other content.

39. Sometimes, the online consumer *does* know who the trader is; a consumer who orders a food processor at Cuisinart.com, for example, can be relatively confident that Cuisinart is the trader. But if that same consumer orders the processor through the Amazon Marketplace, or indeed through a retailer they have found online but have not previously come across, then they may not really know the seller’s identity.

40. Several of these are provided for in the European Union (and currently also the United Kingdom) under the EU Consumer Rights Directive. Council Directive 2011/83, art. 6, 2011 O.J. (L 304) (requiring sellers to provide contact information, characteristics of the goods sold, and information for any out-of-court complaint and redress mechanisms available).

This makes good sense. Consumers have a good understanding of the nature of advertising and marketing and know how to read the messages conveyed. However, in doing so, they adjust, or caveat, the message that the advertising conveys. Consider a consumer who sees an ad for a vacuum cleaner in a newspaper that claims it is the best vacuum cleaner yet invented and that it will leave their house cleaner than they could even imagine. That consumer is likely to view this as brand positioning or “mere puffery,” not necessarily factual. But if the same consumer reads the same information as news content within a newspaper, they will apply a very different lens and may well assume that the content is broadly true.

Advertising can thus be effective in winning customers—but is also potentially misleading if it is not clearly labelled as such. In order to prevent consumers from being misled, while also protecting the long-term value of such advertising, it is thus vital that advertising and news content are clearly distinguished, and this is sometimes provided for by law or within advertising codes of practice.⁴¹

The situation online is in principle the same: consumers must be able to clearly identify online advertising and marketing if they are not to be misled by it. In practice, however, the labeling of advertising content and demarcation between ads and other content can be far from clear.⁴² Even where there is labeling, there seems to be little consistency in how this is done. Common labels include “ad,” “#ad,” “sponsored,” “sp,” “promoted,” or “advertorial,” and sometimes the labels are even less clear—for example, “brand partner,” “brought to you by,” or “contribution from.” Ad labels are often tiny—or in a color very similar to the background—such that they are easy to miss. And if ads are mixed up with organic or other non-ad content on a small screen, it can be hard for consumers to distinguish the two in their mind.

Such a lack of clarity may be in the interest of the platform, however. As highlighted above, consumers are more likely to be influenced by advertising or marketing if they do not identify it as such.⁴³ This, in turn, means platforms may be able to charge traders more for advertising if it is not clearly labeled. Unless

41. For example, this requirement is included in the self-regulatory codes of advertising practice (broadcast and non-broadcast) overseen by the UK Advertising Standards Authority. See *Advertising Codes*, ADVERT. STANDARDS AUTH., <https://www.asa.org.uk/codes-and-rulings/advertising-codes.html> [<https://perma.cc/8DTR-AAEN>].

42. See generally Colin Campbell & Pamela E. Grimm, *The Challenges Native Advertising Poses: Exploring Potential Federal Trade Commission Responses and Identifying Research Needs*, 38 J. PUB. POL'Y & MKTG. 110, 110 (2019) (“The subtle and often masked nature of native advertising raises important questions concerning the format’s potential to deceive consumers. Native advertising blurs the line between advertising and both editorial and consumer-generated content, making it difficult for consumers to identify the advertising. Emerging research on native advertising suggests that consumers may fail to recognize native ads as advertising, leading them to respond more positively to these ads.”).

43. See Ladder, *Ladder Customer Testimonials*, YOUTUBE, at 0:13 (Nov. 5, 2019), <https://www.youtube.com/watch?v=XTQdT1QBH48> [<https://perma.cc/XP5X-W4RS>] (featuring a customer remarking “So, I literally Googled ‘best online life insurance’ and Ladder Life Insurance popped up!”). The top placement in search results often is the result of an ad, not an organic ranking of “best” life insurance, for example.

Consumer Protection for Online Markets and Large Digital Platforms

they are restricted from doing so, platforms may thus be incentivized to blur the lines between advertising/marketing and organic and other non-ad content.

Specific Policy Proposals

- All advertising and marketing should be clearly and prominently labeled as such. This labeling should enable consumers readily to identify paid ads/marketing. Advertising and marketing should also be sufficiently well demarcated from organic content that consumers are readily able to identify which is which. Standards should be developed to specify what demarcation is lawful in a variety of settings.
- Basic guidance and templates should be issued or approved by the regulator on what will be considered suitable labeling online. Many traders and platforms will not be large enough or want to bear the costs of empirically testing how easily consumers are able to identify their advertising and marketing and will prefer to ensure that they meet their legal obligations by following simple guidelines—for example, in terms of label wording, font size, and color.

The above proposals are intended to be applicable to all online firms. We note, however, that Facebook and Google account, between them, for a very large share of all digital-advertising spend in (at least) the United States, the European Union, and the United Kingdom. Given their critical position in relation to advertising media, we argue that a stronger regulatory requirement should be imposed on the largest advertising-funded platforms.

- Given their critical importance in digital advertising, the largest online advertising platforms should be required to carry out regular empirical testing of their labeling and demarcation of advertising. The formal rule for these platforms would be no different (to ensure consumers are readily able to identify paid ads/marketing), but the burden would be placed on them to demonstrate that this is the case, rather than the burden sitting with regulator to demonstrate the reverse.

3. Lack of Ability to Directly Examine Product Quality, and Need for Fair and Non-Misleading Online Quality Indicators

In an offline environment, a consumer seeking to assess the quality of products or services oftentimes can speak face-to-face with a salesperson, confer with a shopping companion, and inspect physical products directly. With the lack of any such physical interaction, online consumers have come to rely heavily on a variety of alternative quality indicators. These include peer reviews and ratings, rankings on search sites, and the views of social influencers.

Specific Policy Proposals

These quality indicators potentially provide valuable information, but this requires that they should be fair and not misleading. Consumer protection can play a key role in ensuring that this is the case, by requiring the following:

- Consumer ratings and reviews should be presented fairly and non-selectively. If consumers are led to believe that they are getting the full picture, then this should be the case—all (genuine and legal) reviews should be shown. If a firm has a policy of removing reviews, it should state clearly and prominently that this is the case, and what the goal is. Any removals should be proportionate to that goal.⁴⁴ Where “average” ratings are shown, there should be clarity on the approach being used to construct the averages. Where simple averages are not used, the firm should explain the goal behind the weightings used, and these should be proportionate to that goal.⁴⁵
- Conditional incentivization of ratings/reviews should also be prohibited. Given the importance of ratings/reviews, many traders incentivize consumers to write them through special offers of one sort or another. There may be merit in this, so long as consumers are not inhibited from expressing their true views. However, some sellers make such incentives conditional on the consumer writing a 5-star review (or equivalent).⁴⁶ This practice is clearly intended to falsely inflate ratings and should be prohibited.
- Fake reviews and ratings should be illegal, as should the service of selling fake reviews and ratings and the hosting of advertising for such services. The importance of reviews and ratings has led some sellers to post fake reviews and ratings, or even to purchase such fake reviews/ratings from third parties. Until recently, services offering fake

44. For example, in 2016, the UK Competition and Markets Authority found that online knitwear retailer, Woolovers, was choosing to publish only positive ratings and reviews on its website. Press Release, Competition & Mkts. Auth., CMA Acts to Prevent Misleading Online Practices (Aug. 11, 2016), <https://www.gov.uk/government/news/cma-acts-to-prevent-misleading-online-practices> [<https://perma.cc/FH6B-M8BB>].

45. Simple averages are not necessarily optimal for consumers. Firms might adjust arithmetic averages based on the informational content of reviews, for example. This practice can benefit consumers by placing greater weight on those reviews and ratings that have more informational value. See Weijia (Daisy) Dai, Ginger Jin, Jungmin Lee & Michael Luca, *Aggregation of Consumer Ratings: An Application to Yelp.com*, 16 QUANTITATIVE MKTG. & ECON. 289, 289 (2018) (constructing “an adjusted average rating and show[ing] that even a simple algorithm can lead to large information efficiency gains relative to the arithmetic average”).

46. A recent investigation by a UK consumer organization found several instances of incentivized ratings on Amazon. See Ellie Hammond, *Amazon ‘Betraying Trust’ of Millions of Consumers with Flawed Amazon’s Choice Endorsement*, WHICH? (Feb. 6, 2020), <https://www.which.co.uk/news/2020/02/amazon-flawed-amazons-choice-endorsement> [<https://perma.cc/BM2Y-XYSU>].

Consumer Protection for Online Markets and Large Digital Platforms

reviews/ratings were even hosted on eBay, Facebook, and Instagram.⁴⁷ Such activity undermines the usefulness and credibility of reviews and ratings. Regulators should be empowered to determine whether a review is fake, publicize what factors contribute to a finding that a review is a fake, and prohibit such fake reviews.⁴⁸

- Social-media “influencers” should be transparent about relevant sponsorship or payments when endorsing a product; such hidden advertising should be illegal, and social-media platforms should have a legal responsibility to prevent it. Social-media influencers are sometimes paid to endorse products while posing as enthusiasts with no financial interest.⁴⁹ Such influencers include bloggers, vloggers, celebrities, and social-media personalities. Paid-for or sponsored endorsement is effectively advertising and should be labeled as such (see above). This labeling should be sufficiently clear and prominent that consumers are readily able identify the paid ads. Hidden advertising should be illegal, and social-media platforms should have a legal responsibility to prevent it. This is partly because platforms should not profit from illegal hidden advertising, but also because they are in the best position to design processes to prevent it.⁵⁰
- Criteria for rankings and inclusion in “best buy” boxes should be stated clearly and prominently; where traders have paid for higher rankings or better positioning, this constitutes advertising and should be clearly labeled as such. Given the huge range of products and services available online, consumers can gain great benefit from ranking services and “best

47. The UK Competition and Markets Authority has been active in requiring these large online platforms to enhance their systems for identifying, removing, and preventing such services. See Competition & Mkts. Auth., *Fake and Misleading Online Reviews Trading*, GOV.UK (Apr. 9, 2021), <https://www.gov.uk/cma-cases/fake-and-misleading-online-reviews> [<https://perma.cc/A7RQ-9G6K>].

48. We note the EU directive on the “better enforcement and modernisation of EU consumer protection rules” introduces the following requirements: (i) traders must inform users on their website or application about how they ensure that reviews posted by consumers are authentic reviews from actual consumers who have used or bought the respective product or service; (ii) traders are prohibited from stating that reviews of a product or service have been submitted by a customer who used or bought the product or service without taking reasonable and proportionate steps to check the accuracy of that statement; and (iii) traders are also prohibited from asking a party to submit false reviews or endorsements, or to misrepresent reviews or social endorsements in order to promote products or services. Council Directive 2019/2161, art. 3(4),(7)(b)23b-c, 2019 O.J. (L 328) (amending Council Directive 2005/29, 2005 O.J. (L 149)). [hereinafter EU Consumer Modernization Directive].

49. See, e.g., Complaint at 12-18, Fed. Trade Comm’n v. Teami, LLC, No. 20-cv-518 (M.D. Fla. Mar. 5, 2020) https://www.ftc.gov/system/files/documents/cases/complaint_4.pdf [<https://perma.cc/78AU-ES8Y>] (alleging that the company paid “well-known influencers” for promoting their products in social media posts that did not clearly disclose that they were paid endorsements).

50. The UK Competition and Markets Authority has accepted undertakings from several social media influencers to make it clear when they have been paid or otherwise incentivized to endorse a product or service. It has also accepted commitments from Instagram that it will do more to prevent hidden advertising, through both changing its policies and introducing new technological checks. See Competition & Mkts. Auth., *Social Media Endorsements*, GOV.UK (Nov. 3, 2022), <https://www.gov.uk/cma-cases/social-media-endorsements> [<https://perma.cc/XC4T-C3EX>].

buy” boxes that help them to make choices. However, these consumer benefits can be limited if the criteria used to rank products or include them in a “best buy” box are not well aligned with the interests of the consumer. Given the importance of these choice tools, there should be a general requirement that criteria for ranking/inclusion are stated clearly and prominently. Critically, where traders have paid for ranking/inclusion, this effectively constitutes advertising and should be labeled as such. Again, this labeling should be sufficiently clear and prominent that consumers are readily able identify the paid ads.⁵¹

Finally, while the above proposals are applicable to all online firms, we believe that especially strong requirements are needed for the largest online intermediation platforms.

Their critical bottleneck position as a route to market for traders means that there is very real potential for them to both mislead consumers and distort competition through their approach to rankings and “best buy” boxes. While greater clarity around criteria used for ranking/inclusion will help, it is far from obvious that consumers always know how to deal with this additional information. Indeed, if the higher rankings and inclusion in “best buy” boxes did not generate additional sales, traders would not pay for it. At the same time, the complexity of information provided to consumers could risk creating information overload and reducing consumer trust.

We therefore propose that for the largest online intermediation platforms, payment for rankings and inclusion in “best buy” boxes should be banned completely. We recognize that this could reduce an important revenue stream for the platforms that they may need to recoup from elsewhere (including by selling ads at the top or along the sides of pages). Nonetheless, it would have a huge benefit in ensuring that rankings and “best buy” boxes on these critical platforms are designed in consumers’ interests to work as well as possible to aid consumers in their decision making.

E. Exploitation of Behavioral Biases

1. Greater Prevalence Online of Subscription-Based Sales and Auto-Renewing Contracts

With the move online, a growing number of products are offered based on ongoing subscription-based contracts. Where consumers might once have bought a daily newspaper, a weekly cinema ticket, an occasional CD, video game, or

51. These requirements are explicitly becoming law in the European Union through implementation of the EU Consumer Modernization Directive. *See* EU Consumer Modernization Directive, *supra* note 48. Even before this directive was adopted, the UK Competition and Markets Authority accepted commitments from a number of hotel online booking sites to improve clarity around their rankings and issued principles for the sector. Competition & Mkts. Auth., *Online Hotel Booking*, GOV.UK (Sept. 13, 2019), <https://www.gov.uk/cma-cases/online-hotel-booking> [<https://perma.cc/3N2F-QSRD>].

Consumer Protection for Online Markets and Large Digital Platforms

audio book, they are now more likely to have a monthly or annual subscription to their favorite newspaper, video-streaming service, music-streaming service, and online-gaming service.

Where subscriptions are in the form of fixed-term contracts, these are often set to “auto-renew,” so the service continues unless it is proactively cancelled. Such subscription-based services can be attractive for consumers in smoothing expenditure and enabling them to try out new music, games, etc. However, they can also result in consumer “lock-in” or inertia, with consumers failing to cancel services they no longer use, or failing to seek out alternative providers that might offer a better service.

Subscription-based sales have long been used in core utility markets, and there is substantial evidence from these markets that consumers exhibit significant inertia that keeps them from searching and switching to better offers. This is concerning partly because consumers are failing to benefit from better deals but also because a lack of search will tend to dampen competition. There is evidence of utility providers gradually raising prices to inactive consumers, creating a substantial “loyalty penalty” relative to the prices they could obtain if they were active.⁵² Regulators have made significant efforts to make search and switching as easy as possible in these markets, although this has not proved straightforward.⁵³

In an online context, the situation is potentially worsened by the ability of platforms to use their choice architecture in a way that makes signing up very easy (or even hard to avoid) while making cancelling or switching extremely difficult. Moreover, many subscription services offer a free initial period before charging consumers. While this can be a valuable way of enabling consumers to try a new service, they are not always reminded that they are about to start paying and can find it unduly difficult to cancel the contract.

Specific Policy Proposals

To ensure that consumers are not unduly locked into long-term subscription-based or auto-renewing contracts, it is vital that consumers are made fully aware of what they are signing up to, that they are reminded about

52. In 2018, the UK Competition and Markets Authority examined five major UK utility markets and estimated a total “loyalty penalty” of £4 billion. See Competition & Mkts. Auth., *Tackling the Loyalty Penalty*, GOV.UK (Nov. 19, 2018), <https://www.gov.uk/government/publications/tackling-the-loyalty-penalty/tackling-the-loyalty-penalty> [https://perma.cc/T6A8-CXB6].

53. See Keith M. Marzilli Ericson, *Consumer Inertia and Firm Pricing in the Medicare Part D Prescription Drug Insurance Exchange*, 6 AM. ECON. J. 38 (2014) (finding that “consumers face switching frictions” that limit the effectiveness of competition in the government-established marketplace for Medicare Part D plans); Xiaopeng He & David Reiner, *Why Do More British Consumers Not Switch Energy Suppliers? The Role of Individual Attitudes 1* (Energy Pol’y Rsch. Grp., EPRG Working Paper No. 1515, 2015), <https://www.eprg.group.cam.ac.uk/wp-content/uploads/2015/09/1515-PDF.pdf> [https://perma.cc/SCC6-MCVH] (noting that few consumers in UK energy and gas markets switch suppliers “despite the potential for financial gains” and showing factors that contribute to switching costs).

their commitment periodically, and that they can cancel and switch easily and efficiently. More specifically, we propose the following:⁵⁴

- For any sale of subscription-based or auto-renewing service, the price and any minimum contract period or minimum purchase obligation should be set out clearly and prominently upfront. Where a service is sold based on an initial free period, the price to be paid after this period should be set out clearly and prominently upfront. These terms should also be sent to consumers through a sign-up email.
- Advance notice should be made before any change to these terms. This should be sent via email, and the change in terms should be clear, prominent, and flagged within the subject header of the email. When terms change, consumers must be given the chance to cancel and to continue using the service for a reasonable amount of time under its prior terms while looking for a new supplier. Free trials should not be converted into paid services without providing specific notice and allowing time to cancel.
- Consumers should be notified of their total ongoing charges from that trader at an appropriate frequency. Consumers can sometimes stack up a variety of subscriptions, sometimes even duplicative ones, so requiring the trader to notify total charges would help to identify this issue. Guidance would be needed as to what an “appropriate frequency” might be, but it should be infrequent enough to engage the attention of consumers but frequent enough to allow for timely decision making.
- There should be a prohibition on the opt-out selling of automatic renewals, whereby a consumer is defaulted into an auto-renewing contract unless they take a specific action not to allow auto-renewal. Signing up for automatic renewals should require active consent by consumers, not be the result of default bias.⁵⁵
- It should be possible to cancel a contract via the same medium as it is entered. That is, there should be no need to phone or write an email or letter to cancel a contract entered online. This obligation could

54. We note that many of the following elements are incorporated in California’s existing Automatic Renewals Law. CAL. BUS. & PROF. CODE §§ 17600-17606 (West 2022). We also note that the Washington Post is currently subject to a class action under this law for not making it clear that the free offer was only for an initial period, and then making it unduly onerous to cancel. *See* Complaint at 21-24, *Jordan v. The Washington Post*, No. 20-cv-05218 (N.D. Cal. July 29, 2020), <https://classactionsreporter.com/wp-content/uploads/Washington-Post-Automatic-Renewals-Compl.pdf> [<https://perma.cc/8KYJ-MCSU>].

55. There is a possibility that such a prohibition could lead subscription services simply to lengthen the minimum term of a subscription. An online magazine that used to sell one-year subscriptions could decide, for example, to sell only two-year subscriptions. The regulator should monitor for this sort of evasive behavior and be empowered to require shorter renewal periods on a case-by-case basis.

Consumer Protection for Online Markets and Large Digital Platforms

potentially be generalized into a principle-based rule that it must be as easy to cancel a contract online as it is to enter it.⁵⁶

- There should be no exit fees (i) after any initial minimum contract period or minimum purchase obligation, or (ii) for any contract that has auto-renewed, or (iii) for any contract offered based on a free initial period. The notice period for any cancellation should not be any longer than 28 days, and thereafter sellers must reimburse pro rata any fees paid in advance for any unused service.⁵⁷
- There should be an easy and efficient mechanism to cancel the service. A consumer should be able to cancel with no more than three clicks. A simple link should be included within the initial sign-up email and all email notifications thereafter. It may be useful to provide further guidance on what a simple cancellation mechanism might comprise. For example, a template “cancellation button” (standardized with respect to color, placement, font, and the like) could be provided; use of this template would then act as a safe harbor against liability. Immediate email confirmation of cancellation with date from which on contract is cancelled should also be required.

As in previous sections, although the above proposals are intended to apply to all, we believe that additional requirements are appropriate for the largest online platforms:

- Where a service involves a regular monetary payment, the platform should be required to contact any user who has not made active use of the service for a year. The regulator should issue guidance as to what constitutes “active use,” which may vary from service to service. If the user does not provide active consent to continuing the service, the platform should be required to terminate the service and cease taking payments.⁵⁸

56. See *Federal Trade Commission Proposes Rule Provision Making it Easier for Consumers to “Click to Cancel” Recurring Subscriptions and Memberships*, FED. TRADE COMM’N (Mar. 23, 2023), <https://www.ftc.gov/news-events/news/press-releases/2023/03/federal-trade-commission-proposes-rule-provision-making-it-easier-consumers-click-cancel-recurring>.

57. From a behavioral-economics perspective, we acknowledge that the ability to cancel at any time risks undesirable consequences. If procrastination is, for example, driven by naïve, hyperbolic discounting, this rule could increase the amount of procrastination. At the same time, it could reduce procrastination deriving from consumers’ overestimating their future likelihood of remembering to do so or underestimating the future hassle cost of doing so. We believe that on average, it is likely to increase the cancellation of contracts with undesirable features.

58. We note that Netflix has recently adopted this proposal voluntarily as good practice. Eddy Wu, *Helping Members Who Haven’t Been Watching Cancel*, NETFLIX (May 21, 2020), <https://about.netflix.com/en/news/helping-members-who-havent-been-watching-cancel> [https://perma.cc/UF3K-VM6B].

- Where considered appropriate, the regulator should have the power to impose a requirement on platforms that consumers be able to port their data to a new provider, on a continuous, real-time basis. This will facilitate both one-off switching and ongoing multihoming.⁵⁹ For data portability to work in a safe and secure way, the regulator may also need to accredit or license third-party providers to ensure they meet the standards the government laws down for privacy, security, etc. Clear rules on liability for both the sending and receiving platforms may also be required.
2. Importance of Interface Design and Online Choice Architecture for Consumer Decision Making, and the Potential for it to Act Against Consumers' Interests

A fourth key difference between online and offline relates to the observation that consumer behavior can be strongly influenced by the way in which choices are presented to them. This is also known as “choice architecture,” and it is a key element in online-interface design. We know, for example, that consumers exhibit strong “default bias.”⁶⁰ One implication is that their choices can be strongly influenced by whether a particular box is initially ticked or unticked. We also note that settings vary, and what is appropriate to protect consumers may differ in different cases. We propose general policies below but recommend that the regulator be tasked with studying different cases and adjusting as needed to achieve consumer protection goals.

It is impossible for platforms to avoid providing some form of choice architecture for consumers. And it is difficult to make this architecture entirely “neutral” in terms of leading consumers to replicate exactly the choices they would make if given the necessary time and information (as well as incentives to become informed about the consequences of their choice) to make a careful and deliberate decision. The “neutrality” regulation should not be designed to prevent the platform from helping consumers in their decision making.⁶¹

However, there is an obvious incentive for platforms to bias the design of choice architecture in their own interest, or in the interest of their business users, rather than in the interest of consumers. Take the default-bias example above and

59. In the European Union, this proposal has been adopted through the Digital Markets Act. Council Regulation 2022/1925, art. 6(9) 2022 O.J. (L 265).

60. See, e.g., Eric Johnson, Steven Bellman & Gerald Lohse, *Defaults, Framing and Privacy: Why Opting In-Opting Out*, 13 MKTG. LETTERS 5, 5 (2002) (showing that default settings have “a major role in determining revealed preferences for further contact with a Web site”). For additional research on choice architecture, see, for example, Idris Adjerid, Alessandro Acquisti & George F. Loewenstein, *Choice Architecture, Framing, and Cascaded Privacy Choices*, 65 MGMT. SCI. 2267 (2018) (examining the impact of choice architecture involving a series of decision points); and Nuria Rodríguez-Priego, René van Bavel, José Vila & Pam Briggs, *Framing Effects on Online Security Behavior*, 21 FRONT. PSYCHOL. 11 (2020) (examining the impact of choice architecture on security-related choices).

61. See John M. Yun, *Does Antitrust Have Digital Blind Spots?*, 72 S.C. L. REV. 305, 343 (2020) (arguing that “[d]efaults can have a strong efficiency justification,” and “sweeping bans on defaults . . . could conceivably reduce welfare”).

Consumer Protection for Online Markets and Large Digital Platforms

suppose that a particular box commits the consumer to buying an add-on product they don't necessarily want—say flight insurance on an airline ticket. Pre-ticking this box would tend to increase sales of the add-on, because some percentage of consumers will fail to untick the pre-ticked box. They will do this even though they don't need the insurance and would never tick an unticked box. This is a form of “inertia selling” known as “opt-out” selling. It will typically be in sellers' interests but not consumers'.⁶²

Where choice architecture is designed to take consumers down pathways that are more in sellers' interests than their own, it is sometimes referred to as containing “dark patterns.”⁶³ Examples of such misleading conduct that are often highlighted include:

- the creation of a false sense of urgency or scarcity—for example by showing a countdown timer, which in turn puts pressure on consumers and is likely to lead to their making worse decisions; or by showing misleading low stock or high demand messages like “Just one left at this price,” or “Seven people are currently viewing the item”;⁶⁴
- the prominent display of partial price information, with full prices only observed at a late stage of the purchasing process (known as “drip pricing”) or providing prices on a broken-down level with the full price not prominent (known as “partitioned pricing”). Both practices have been shown to worsen consumer decision making and, in particular, to reduce consumer search (which is in turn likely to lead to worse choices and also harm competition);⁶⁵

62. In theory, such “opt-out” selling of an add-on product could be beneficial for consumers too, if they really need a product and default bias might otherwise lead to under-purchase (too little ticking of an unticked box). An analogous argument was made on appeal against the UK Competition Commission's intervention to prevent payment protection insurance being sold alongside loans. The appellant's argument was that consumers would otherwise not buy an insurance product which was of genuine value to them. The evidence in that case did not support the appellant's claim. See *Payment Protection Insurance Market Investigation: Remittal of the Point-of-Sale Prohibition Remedy by the Competition Appeal Tribunal Final Report*, COMPETITION COMM'N 27-44 (Oct. 14, 2010), <https://assets.publishing.service.gov.uk/media/5519489040f0b61401000159/report.pdf> [<https://perma.cc/44XB-T2US>]. More generally, however, given the incentives of firms to oversell add-ons, it seems right—both economically and ethically—that consumers should make a positive choice when they are making a purchase.

63. See Bureau of Consumer Prot., *Bringing Dark Patterns to Light*, FED. TRADE COMM'N 1 (Sep. 2022), https://www.ftc.gov/system/files/ftc_gov/pdf/P214800%20Dark%20Patterns%20Report%209.14.2022%20-%20FINAL.pdf [<https://perma.cc/WRT2-DSUZ>].

64. Messages creating urgency and scarcity were the most common forms of dark pattern found online in a web sweep of 11,000 shopping sites. Arunesh Mathur, Gunes Acar, Michael Friedman, Elena Lucherini, Jonathan R. Mayer, Marshini Chetty & Arvind Narayanan, *Dark Patterns at Scale: Findings from a Crawl of 11K Shopping Websites*, 3 PROC. ACM HUMAN-COMPUTER INTERACTION 81:1, 81:14-16, 81:19-21 (2019).

65. For evidence of the detrimental impact of drip pricing and partitioned pricing on consumer decision making, see Steffen Huck & Brian Wallace, *The Impact of Price Frames on Consumers Decision Making: Experimental Evidence* (Oct. 15, 2015), <https://www.ucl.ac.uk/~uctpbwa/papers/price-framing.pdf> [<https://perma.cc/7TZ7-K9DJ>]; and Charlotte Duke, Miriam Sinn, Steffen Huck & Brian Wallace, *Partitioned Pricing Research: A Behavioural Experiment*, OFF. OF FAIR TRADING (Aug. 2013),

- the use of techniques such as brightly colored buttons, pop-ups, prominence, or obfuscating wording that encourage consumers to sign up for products or services without giving the choice much (if any) attention.⁶⁶ While these aspects of interface design are not bad in themselves and can help consumers to make good choices, they can nonetheless cross the line into being misleading.

Many of these concepts are also relevant offline, but online platforms are in an especially good position to maximize the impact of their choice architecture. As discussed above, this is due to the combination of three related factors: (i) extensive data about individual consumer behavior; (ii) machine-learning algorithms that can mine these data for relevant behavioral patterns; and (iii) A/B testing techniques that are designed to industrialize trial-and-error experimentation to maximize the choice architecture's effect on users.

Specific Policy Proposals

Consumer-protection law has an important role to play in ensuring that online choice architecture functions aid good consumer decision making, rather than mislead consumers. We therefore support the following proposals:

- Ban the use of defaults that require a consumer to “opt-out” in order to avoid a financial commitment (one form of inertia selling).⁶⁷ These often take the form of pre-ticked boxes to enroll, subscribe, or purchase the most expensive option but would include any situation in which inactivity on the part of a consumer leads to a purchasing “choice.”⁶⁸

https://webarchive.nationalarchives.gov.uk/20140402165048/http://oft.gov.uk/shared_oft/economic_research/OFT1501A.pdf [<https://perma.cc/8G8N-QDZV>]. However, for an example in which drip pricing did not affect consumer purchase behavior, see Markus Dertwinkel-Kalt, Mats Köster & Matthias Sutter, *To Buy or Not to Buy? Price Saliency in an Online Shopping Field Experiment*, 130 EUR. ECON. REV. 1, 11 (2020). The authors also discuss the differences between their conclusions and the prior literature. See Dertwinkel-Kalt et al., *supra* note 65, at 11.

66. See, e.g., *ASA Ruling on Amazon Europe Core Sarl*, ADVERT. STANDARDS AUTH. (Oct. 30, 2019), <https://www.asa.org.uk/rulings/amazon-europe-core-sarl-G19-1021643.html> [<https://perma.cc/99DJ-BVNI>]

67. In the European Union and the United Kingdom, the Unfair Commercial Practices Directive contains a general prohibition of inertia selling, Council Directive 2005/29, ch. 4, art. 15, 2005 O.J. (L 148); while the “opt out” selling of add-ons (including through pre-ticked boxes) has now been specifically banned under the EU Consumer Rights Directive, Council Directive 2011/83, art. 22, 2011 O.J. (L 304).

68. Note that this regulation would not prevent additional products from being included as part of a bundle, with the consumer having the potential to make an active choice to remove the option, and so gain a discount. The difference in this case would be that the upfront advertised price of the bundle would be required to include the add-on; in effect, it would not function as an “add-on,” but rather as part of the core product offering.

Consumer Protection for Online Markets and Large Digital Platforms

- Ban the use of messages that create a false sense of urgency or scarcity, which in turn lead consumers to make rushed and pressurized decisions.⁶⁹
- Require that prices be displayed prominently upfront and include all unavoidable fees and charges.⁷⁰ Where unavoidable fees and charges can only be calculated at a later stage, they should be included as soon as they are calculable. Any fees and charges that have not been provided before the “checkout” stage of the purchasing process should be cost-reflective.
- More generally, prohibit interface design which acts to misdirect consumers. This prohibition would address aspects such as misdirection through brightly colored buttons, pale wording, or other aspect of interface design.⁷¹

The focus of the above is ensuring that choice architecture does not mislead consumers. These proposals are applicable to all online firms. As in previous section, however, we argue that stronger requirements are appropriate for the largest online platforms, given their critical and economy-wide role in consumer decision making.⁷²

- The largest online platforms should be given specific responsibility to ensure that their choice architecture is neutral. A neutral choice architecture is one that does not present biased selections to the consumers and, to the extent it is possible, allows them to make the same choice that they would make if they had the time and information, as well as incentives, necessary to make a careful and deliberate choice. The largest online platforms should have the resources and capabilities to design such choice architectures and to demonstrate their impact.⁷³

69. False scarcity and urgency messages were another element of the recent intervention by the UK Competition and Markets Authority against hotel online booking sites. *See supra* note 51 and accompanying text.

70. The UK Competition and Markets Authority has recently led EU-wide action in relation to the transparency of car rental sites, to ensure that key information is displayed clearly and prominently upfront with no unexpected hidden fees and charges. *See* Press Release, Competition & Mkts. Auth., CMA Leads Europe-Wide Action on Car Hire (Mar. 25, 2019), <https://www.gov.uk/government/news/cma-leads-europe-wide-action-on-car-hire> [<https://perma.cc/84X6-Y4JG>].

71. In a recent FTC enforcement action, a key finding was that the salient information for consumers was at the bottom of the page (which required scrolling) and was in faint type on a white background. *See* Lesley Fair, *Time for a ROSCA Recap: FTC Says “Risk Free Trial” was Risky—and Not Free*, FED. TRADE COMM’N (Jul. 3, 2018), <https://www.ftc.gov/news-events/blogs/business-blog/2018/07/time-rosca-recap-ftc-says-risk-free-trial-was-risky-not-free> [<https://perma.cc/XW82-YSLJ>].

72. *See supra* note 35 and accompanying text.

73. New techniques are being developed that could play a role in enabling platforms to self-assess their choice architecture. *See* Dilip Soman, Daniel Cowen, Niketana Kannan & Bing Feng, *Seeing*

F. Data Privacy and Manipulation

1. Growth in Online Services that are Ostensibly Free, but That in Practice Monetize Consumer Data and Attention

A sixth difference between online and offline markets is that a greater range of services are provided for no monetary price to consumers and monetized by other means (such as advertising or data collection). In the offline world, consumers have long benefited from numerous free radio and TV channels and newspapers, which were advertising funded. Such “free” services have ballooned online, with consumers having free access to a wealth of different services, from social networks, to email, to mapping apps, to games, to audio-visual communications services, and much more.

Consumers certainly benefit from these services, but they are hardly “free.” Consumers effectively barter for them with their attention and/or their data. As such, there is still a seller-consumer transaction that platforms can abuse—for example, by making it hard for consumers to understand what they are signing up for, extracting more data than consumers realize, or making it difficult for them to switch.

Specific Policy Proposal

Consumers should have the same rights when they receive services in a barter setting as they possess when they pay money for them. However, existing consumer-protection law sometimes refers to “sales practices” or “transactions,” which are terms which might be viewed as implying a monetary payment. Therefore, we propose that:

- All relevant consumer protection legislation should *explicitly* apply to digital content and digital services that are provided free of charge but in exchange for personal data, except where such personal data is only used to supply the digital content or service, or to comply with the law.⁷⁴

2. Greater Online Collection and Use of Extensive Personal Data

The extent of consumer data that is collected and used by online firms, whether free or paid-for, has ballooned over the past decade and goes well beyond anything observed by way of data collection in the offline world. These data can have a multiplicity of uses. They can act as an input to provide and

Sludge: Towards a Dashboard to Help Organizations Recognize Impedance to End-User Decisions and Action, ROTMAN SCH. OF MGMT. 21-30 (Sept. 24, 2019), <https://static1.squarespace.com/static/5d1e3407108c4a0001f99a0f/t/5d8a6fc416577b70f51b896c/1569353670613/BEARxBIOrg-Seeing-Sludge-1.pdf> [<https://perma.cc/W5EZ-RKB6>]. A/B testing of outcomes is also likely to be crucial.

74. This change is being implemented in the EU through the EU Consumer Modernization Directive. See EU Consumer Modernization Directive, *supra* note 48, art. 4(2)(b).

enhance the service in question. They can also facilitate monetization of the service—for example, by allowing targeted advertising or sales. Data from one market can also be useful for other activities, not directly related to the service received by the customer, and potentially also monetizable in that wider context.

In agreeing to provide their data for some valuable future use, consumers could be seen as paying “in kind” for the service they receive. However, unlike the situation with standard prices, it is rarely clear to consumers exactly what data they are providing or how it will be used going forward. Moreover, platforms have an incentive both to obfuscate and to offer defaults that encourage consumers to sign up to maximally extensive data collection and use.

When consumers are informed about the extent of the data they are providing and how it is used, their level of concern tends to increase.⁷⁵ At the same time, consumers are not inclined to spend significant time trying to address this issue, as demonstrated by the EU experience of GDPR consent requirements in which consumers are given a “take-it-or-leave-it” choice and become “click-happy,” always saying yes.⁷⁶

This is not unreasonable behavior. As discussed above, life is simply too short to review all the detailed terms and conditions for the many services for which we all sign up. It is not that consumers are stupid or lazy. Rather, in many circumstances, the details of the terms and conditions make it difficult (in time or expertise) to make a choice. Moreover, the “choice” is not really a choice at all, but effectively a “take-it-or-leave-it” offer, which the consumer needs to accept if they wish to receive the service.⁷⁷ Because many of these services hold significant market power or even monopoly power, the situation from the standpoint of the consumer is very different from, for example, shopping for groceries, where they can easily choose to purchase a product *without* high fructose corn syrup rather than a similar product *with* it.

There is an analogy to the offline issue of credit. Unless credit offerings are explained in a clear, highly simplified, standardized, and easily comparable format, consumers struggle to make good decisions and don’t bother to read the fine print. As such, regulators in many jurisdictions dictate the format in which credit information is provided (e.g., APRs) and the font sizes that must be used.⁷⁸

75. *The Price of Accuracy: Consumer Attitudes to Data and Insurance*, ASS’N OF BRITISH INSURERS & BRITAINTHINKS 16 (2019), https://www.abi.org.uk/globalassets/files/publications/public/data/britain_thinks_consumer_data_insurance_report.pdf [<https://perma.cc/63LZ-LAK3>].

76. See Martin Degeling, Sascha Fahl, Thorsten Holz, Florian Schaub & Christine Utz, *(Un)informed Consent: Studying GDPR Consent Notices in the Field*, PROC. ACM CONF. ON COMPUT. & COMM’S SEC., Nov. 2019, 973 (discussing the impact of decision fatigue and choice architecture on GDPR opt-in rates).

77. In its market study into digital advertising, the UK Competition and Markets Authority found that several social media platforms either gave consumers no real choice about giving up their data and accepting targeted advertising, or even if a choice was formally available, utilized strongly nudges and defaults to achieve the same outcome. See *Online Platforms and Digital Advertising: Market Study Final Report*, COMPETITION & MKTS. AUTH 177 (July 1, 2020), <https://www.gov.uk/cma-cases/online-platforms-and-digital-advertising-market-study#final-report> [<https://perma.cc/JNY8-6LLJ>].

78. See 12 C.F.R. § 1026.60(a)(1) (2017) (regulating font size and bold type for consumer credit reporting).

Specific Policy Proposals

In an online environment, there is equally a need for the regulator to develop or approve a simplified, standardized format for disclosing the privacy features of particular services, which consumers can learn and get used to using. This could usefully contain standardized levels of privacy so that a consumer who invested in learning that they are comfortable with Level 2 privacy could select Level 2 the next time they were confronted with a choice. Such a standardized format would be most useful if it applied across all digital services that collect data from consumers. Service providers could then offer different product offerings to consumers, based on different privacy features. Recognizing that this is never going to be a straightforward choice, consumers will nonetheless be in a far better position to make reasoned trade-off than they are today.

Therefore, we recommend the following:

- The regulator should develop a simplified, standardized way of presenting privacy features, and online firms should be mandated to use it. The regulator should ensure that the choice screen has simple language and graphics so that it is accessible to a large fraction of consumers.⁷⁹
- Consideration should also be given to enabling this standardized privacy system to allow consumers to set upfront limits on the amount and types of personal data that can be gathered. These limits would then become the default limits for that consumer across different apps and services. The consumer would only be alerted to provide active consent if a particular site offered different privacy protections or gathered more or different data than the consumer had chosen as their preferred defaults.
- Absent this, the regulator should at least develop default standards for the amount and types of personal data that can be collected without requiring active consumer consent. Firms wishing to collect more or different data than permitted by the default standards would be required to obtain active consumer consent. This would be valuable in overcoming the issue of “click-happy” consumers. This minimum-privacy standard should explicitly exclude both the possibility of selling the personal data and the limitation of liability for third-party use of data. If this were done, then any privacy notification would signal something out of the ordinary that was genuinely worthy of a consumer’s attention.

79. Apple is developing a format that may provide a useful basis for such a requirement (but it should also cover Apple’s operating system itself). Brian X. Chen, *What We Learned From Apple’s New Privacy Labels*, N.Y. TIMES (Jan. 27, 2021), <https://www.nytimes.com/2021/01/27/technology/personaltech/apple-privacy-labels.html> [<https://perma.cc/5ZTX-9PDN>].

Consumer Protection for Online Markets and Large Digital Platforms

Firms in turn may wish to avoid triggering such a notification, and thus this standard would likely become the industry norm, reducing the requirement for consumers to make difficult choices in this area for themselves, while still allowing firms to diverge if they wish.

3. The Need to Prevent the Use of Data to Discriminate Against Vulnerable Consumers

A further implication of the extensive collection of personal data described above is that it can be used by large online firms to make highly personalized offers that depend on details of the consumer circumstances as well as past behavior and responses. Indeed, using machine-learning algorithms, these firms may be better able to predict the consumer's future behavior than the consumer themselves. Again, although individualization is also observed in an offline world (a clothing salesperson may show an unusually tall person brands or styles that run large, for example), the potential for individualization is far greater online.

Some forms of individualized treatment can be positive for consumers. Many consumers value advertising and sales offers that reflect their interests. But individualized treatment can also be detrimental to consumers. For example, it may allow firms to successfully extract consumer surplus by price discrimination through personalized pricing or offers (and especially when firms have significant market power).

Individualization is also less likely to be beneficial if it is associated with consumers' biases or weaknesses.⁸⁰ Firms can potentially target individual consumers with advertising or sales offers that are designed to exploit their unique fallibility. A particular focus online has been on the marketing of inappropriate products to children. However, the individualization possibilities online expand the traditional notion of "vulnerable consumers" beyond a group characterized by demographics (e.g., the young or the elderly) to a wider set of circumstances. Online examples might include:

- firms selling overpriced mortgages or other financial products with "exploitative features" to consumers who reveal in some way that they are less likely to find a more suitable product;⁸¹
- advertising platforms serving up ads for casinos to individuals searching for advice about problem gambling, or who have or are attempting to stop gambling;⁸²

80. This is true even when markets are competitive. *See* Heidhues & Kőszegi, *supra* note 22, at 545-551 (discussing price discrimination based on the naivete of certain consumers).

81. *See id.* at 546.

82. *See* Adam Satarino, *What a Gambling App Knows About You*, N.Y. TIMES (Mar. 24, 2021), <https://www.nytimes.com/2021/03/24/technology/gambling-apps-tracking-sky-bet.html> [<https://perma.cc/Y9NY-VA4E>].

- ads for fraudulent financial services to individuals searching for high-yield investments;⁸³
- individuals being targeted at a particular moment of weakness, for example when their mood is expected to be low.⁸⁴

Specific Policy Proposals

- Platforms should not be permitted (through algorithms or direct targeting) to discriminate against consumers based on their membership in any (in the United States) protected class (race, religion, gender, etc.) or any group identified by the regulator/government to be vulnerable to particular sales practices or services. High-paying-job ads should not be shown primarily to men, for example, or high mortgage interest rates to Black consumers, or financial scams to the elderly.
- Traders should be required to inform consumers when a price is personalized based on automated decision making.⁸⁵ They should also set out the criteria on which personalization is based.⁸⁶ This would help provide a reputational check against forms of price personalization that are considered socially egregious. As an example, Uber has been accused of charging higher prices to users whose cell-phone batteries were low, where they were thus less likely to take the time to search for

83. As the UK's Financial Conduct Authority illustrated, Google listed ads for financial scams in response to searches for "high-return investment." See Mathew Vincent, *UK Regulator Says Google Not Doing Enough About Scam Ads*, FIN. TIMES (Sep. 24, 2020), <https://www.ft.com/content/ca700726-c48c-4132-953b-8d6a1e57f00c> [<https://perma.cc/PWQ2-RJU4>].

84. An example might be advertisers using specialists such as Weather Ads to match their Facebook ads to local weather conditions, which in turn affects the consumer's mood and tendency to buy certain products. See *Facebook Weather Targeting—How to Sync Your Facebook Ads with Weather*, WEATHERADS, <http://www.weatherads.io/facebook-weather-targeting> [<https://perma.cc/BW29-T3WX>]. This is broadly in line with academic research illustrating that current weather conditions affect purchases behavior. See, e.g., Michael Conlin, Ted O'Donoghue & Timothy J. Vogelsang, *Projection Bias in Catalog Orders*, 97 AM. ECON. REV. 1217, 1217 (2007); Meghan R. Busse, Devin G. Pope, Jaren C. Pope & Jorge Silva-Risso, *The Psychological Effect of Weather on Car Purchases*, 130 Q.J. Econ. 371, 385 (2015); Tom Y. Chang, Wei Huang & Yongxiang Wang, *Something in the Air: Pollution and the Demand for Health Insurance*, 85 REV. ECON. STUD. 1609, 1610 (2018). We also note concerns that Spotify (which is increasingly moving into advertising) has developed speech-recognition technology that can detect, among other things, emotional state, gender, age, and accent. See Mark Savage, *Spotify Wants to Suggest Songs Based on Your Emotions*, BBC (Jan. 28, 2021), <https://www.bbc.com/news/entertainment-arts-55839655> [<https://perma.cc/P7HJ-5EK4>]; *Spotify, Don't Spy: Global Coalition of 180+ Musicians and Human Rights Groups Take a Stand Against Speech-Recognition Technology*, ACCESSNOW (May 4, 2021, 7:00 AM), <https://www.accessnow.org/spotify-spy-tech-coalition> [<https://perma.cc/ZR2J-TRCU>]. Furthermore, there are concerns regarding the use of a patent for which Uber applied that would identify drunk or drugged users of the Uber app. See Arwa Mahdawi, *Uber Developing Technology that Would Tell If You're Drunk*, GUARDIAN (June 11, 2018), <https://www.theguardian.com/technology/2018/jun/11/uber-drunk-technology-new-ai-feature-patent> [<https://perma.cc/MZV6-TA4G>].

85. This is being introduced in the European Union as part of the EU Consumer Modernization Directive. EU Consumer Modernization Directive, *supra* note 48, art. 4(4)(a)(ii).

86. For a discussion of the benefits of public explanation of personalized pricing, see Bruce Lyons & Robert Sugden, *Transactional Fairness and Pricing Practices in Consumer Markets* 30 (Ctr. For Competition Pol'y, Working Paper No. 21-03, Jan. 28, 2021).

Consumer Protection for Online Markets and Large Digital Platforms

a lower price. Uber has denied this practice but has accepted that this would be technologically feasible.⁸⁷ We presume that its main reason for not engaging in such a pricing strategy is reputational.

- The law should explicitly permit reverse engineering for research or policy purposes. Currently, algorithmic discrimination is most often proven through reverse engineering algorithms and reviewing their outcomes. However, such activity may breach laws relating to data scraping,⁸⁸ and academics working in this area, typically in the public interest, may be fearful of running afoul of these laws. Clarification that the law allows this use would help to support such socially useful research.⁸⁹

As in previous sections, we argue that the largest online platforms merit additional requirements.

- For the largest online platforms, personalized rankings and targeting (whether of advertising or sales offers) should not be permitted to be based on characteristics designed to predict vulnerability. The regulator would be required to provide guidance on what is meant by vulnerability for the purpose of this provision. A test could be devised that is similar to the neutrality test above.
- The largest online platforms should be required to set out publicly their approach to targeting and how they ensure that their systems do not result in inappropriate targeting of vulnerable consumers. This transparency measure would help incentivize good conduct by the platforms as well as provide valuable information for the regulator to monitor and enforce the previous requirement.

4. Prevalence of Network Effects for Digital Platforms

Many digital platforms tend to exhibit network effects, where the value of the platform to any user will increase with the total number of platform users. For example, a person might value Facebook more than Snapchat because far more of their friends are on Facebook. This means that platforms—especially when starting out—have strong incentives to increase their user base through illicit means.

87. See Jessica Lindsay, *Does Uber Charge More If Your Battery is Lower?*, METRO (Sep. 27, 2019), <https://metro.co.uk/2019/09/27/uber-charge-battery-lower-10778303> [<https://perma.cc/U6NR-HGHZ>].

88. See Herbert Swaniker & Alex Sisto, *Scraping the Barrel? Legal Issues Arising from Data Scraping*, CLIFFORD CHANCE (Dec. 14, 2018) (discussing issues regarding data scraping under data privacy and trade secrets law).

89. We note that data scraping imposes a cost on websites, but websites can overcome this by providing open APIs to allow direct data download. If data scraping were clearly legal, sites would have more incentives to open up their data for research in this way.

Dating sites provide a good example. In recent years, a firm with several dating sites was found to have cross-registered members across their different sites without the members' knowledge.⁹⁰ Pursuant to a Competition and Markets Authority enforcement action, the firm promised not to falsify its member numbers and to make it easier for people to take down their profiles when they cancel their subscription.⁹¹ The Federal Trade Commission alleged that another dating site had advertised messages from known scammers to gain new members.⁹² By using such deceptive tactics to imply a larger number of potentially available dates or partners, dating platforms can keep users engaged and benefit from their willingness to pay for continuing to use the service.

Specific Policy Proposal

- Membership platforms should be barred from cross-registering members across their services without their active consent, and from creating fake profiles. When people cancel their membership, their profile should be automatically removed unless they explicitly consent otherwise.

G. The Private Policing Role of Platforms

1. Gatekeeper Policing of Third-Party Business Users

A final important characteristic of large digital platforms is that they play two relevant roles. The focus of the discussion above has been on ways in which digital platforms might directly create or exploit ineffective consumer choice. However, many digital platforms also act as critical routes to market for business users, either as sales intermediaries or as advertising media. They are therefore a key medium through which these third parties can act to treat consumers poorly or fraudulently. Moreover, in some cases their conduct can exacerbate this harm, as shown by the fraudulent financial services example above.

In this “intermediation” role, platforms are in a unique position to monitor and restrict activity by business users to ensure that it is neither fraudulent nor otherwise in breach of consumer protection rules.

For a discussion of the use of “chat moderators” on a variety of dating apps in Germany, see Jana Gieselmann & Alexander Rasch, *Platform Investment Incentives: Dating and Fake Profiles 2* (May 6, 2021), https://www.tse-fr.eu/sites/default/files/TSE/documents/conf/2021/doctoral_workshop/gieselmann.pdf [<https://perma.cc/A7TN-V227>].

Consumer Protection for Online Markets and Large Digital Platforms

Given that platforms earn money from being a conduit, it could be argued that the platforms already have a responsibility to do this. Indeed, some already do, to greater or lesser extents. For example, we assume that Amazon has strong incentives to protect consumers against the sale of fake goods, not least because its own approach to inventory management means that the goods of different traders are often combined, and consumers cannot rely on getting their goods sold from the precise trader they have chosen. Likewise, during the early phase of the COVID-19 pandemic, Amazon was active in preventing the sale of fake cures.⁹³

Platforms do not always have the right incentives to play this role, however, both due to the associated loss of revenue and because the process of effective monitoring and enforcement can be costly. Investigations and enforcement actions in various jurisdictions suggest that travel sites have failed to make clear that hotels impose resort fees, that a concert ticket aggregator has obfuscated service charges, and that a home rental service has failed adequately to disclose hosts' fees.⁹⁴ These examples demonstrate not just that platforms acting as intermediaries do not always have the right incentives, but that platforms actually have acted on these misaligned incentives, to the detriment of consumers.

Specific Policy Proposals

- The largest gatekeeper platforms should be made responsible for taking all reasonable steps to prevent third-party business users from engaging in illegal sales practices that breach consumer-protection law via their platforms. If they fail to take all reasonable steps—as defined by ex-ante standards that prescribe the required reasonable steps—they should be liable as if they had engaged in the violations themselves.⁹⁵
- The largest online platforms should be required to set out publicly their approach to the previous requirement and publish key performance indicators demonstrating their effectiveness. This transparency measure would help incentivize good conduct by the platforms as well as provide

POST (Feb. 28, 2020), <https://www.washingtonpost.com/technology/2020/02/28/facebook-twitter-amazon-misinformation-coronavirus> [https://perma.cc/L55J-H5FS].

94. See, e.g., Press Release, Fed. Trade Comm'n, *FTC Warns Hotel Operators that Price Quotes that Exclude 'Resort Fees' and Other Mandatory Surcharges May Be Deceptive* (Nov. 28, 2012), <https://www.ftc.gov/news-events/press-releases/2012/11/ftc-warns-hotel-operators-price-quotes-exclude-resort-fees-other> [https://perma.cc/8Q8L-JST2]; *Online Event Tickets Workshop*, FED. TRADE COMM'N (Jun. 11, 2019), <https://www.ftc.gov/news-events/events-calendar/2019/03/online-event-tickets-workshop> [https://perma.cc/M8NY-VUQA]. Johannes Johnen and Robert Somogyi argue that theoretically, platforms can have an incentive to allow sellers to use nontransparent fees and discuss a number of consumer protection cases concerned with such nontransparent fees. Johannes Johnen & Robert Somogyi, *Deceptive Products on Platforms* 10-13 (NET Inst., Working Paper No. 19-13, Sep. 2019), http://www.netinst.org/Somogyi_19-13.pdf [https://perma.cc/RE8V-8CHQ].

95. We note that the recently enacted EU Digital Services Act introduces some responsibility in this area. See Council Regulation 2022/2065, arts. 25-33, 42, 2022 O.J. (L 277).

valuable information for the regulator for monitoring and enforcement of the previous requirement.

2. The Need to Protect Consumer-to-Consumer Platform Transactions

Another key difference between online and offline markets is that individuals are far better able to participate on the supply-side as well as the demand-side. The amount of customer-to-customer (C2C) trading on platforms such as eBay, Craigslist, and Airbnb is far greater than was ever observed through classified ads in an offline environment. Such C2C trading is valuable in allowing the optimal use and re-use of resources, and it brings huge benefits. However, consumer-protection law typically only protects consumers when acting on the demand-side of any trade. Moreover, it only protects consumers against poor treatment by business sellers, and it is not always obvious to consumers whether they are dealing with a business or a consumer seller.

The success of the main C2C platforms partly reflects the investment they have made in finding alternative routes for protection of their customers, on both sides of the platform, which has earned many of them a substantial degree of trust. However, this form of “self-regulation” has been imperfect, and customers often complain that they find out too late they were purchasing from an individual, not a business, and thus have no recourse under consumer-protection law.

Specific Policy Proposals

There is a need to complement the valuable consumer-protection measures introduced by C2C platforms themselves to promote and justify consumer trust.

- C2C platforms should require sellers to state whether they are a business or an individual.⁹⁶
- C2C platforms are themselves sellers of services to their trader customers. Where these are individuals, standard consumer-protection law should apply to the intermediation service sold by the platform to the trader, even though the traders are formally a seller rather than a consumer. Effectively, such individuals should be viewed as consumers of the platform’s intermediation service.

We note that, beyond individual traders, there is an argument that small traders have important similarities to end consumers in terms of their fragmentation and their lack of bargaining power against large digital platforms. As such, some elements of consumer protection—for example, relating to

96. This requirement is currently being introduced in the European Union as part of the EU Consumer Modernization Directive. EU Consumer Modernization Directive, *supra* note 48, at (26).

transparency—could usefully be extended to them too. We have not sought to cover the treatment of small traders in this Article, but we note that in the European Union and United Kingdom, the “Platform-to-Business” Regulation goes some way towards this,⁹⁷ and the Digital Markets Act introduces some additional protections for business users of the largest online platforms.⁹⁸

IV. Enforcing Online Consumer Protection Regulations

For all the policy proposals above, a further issue is how an enforcer can assure itself that platforms are abiding by the requirements. For most online firms, it may be sufficient to rely on a combination of complaints about breaches to public enforcers with the ability to gather information and impose significant sanctions, and private litigation rights.

For the largest gatekeeper platforms, however, in light of their outsize importance, we recommend a more proactive regulatory approach, including:

- requiring the platforms to report, on request, details of their A/B testing in particular areas;
- requiring the platforms carry out A/B testing to check the impact of their activities, and that they make the results of this A/B testing available to the relevant public body;⁹⁹
- requiring the platforms to make data available (in properly anonymized form) either directly or indirectly via regulators to academics doing research, so they can identify misleading patterns;
- and requiring the platforms to adopt fair and transparent complaint procedures and terms of use that do not contain any prohibition against users making a complaint to the regulator or any other relevant public body.

The regulator itself should establish whistleblower procedures that permit platform employees to provide relevant public bodies with information about breaches of consumer-protection requirements, on a confidential basis, and potentially even receive compensation (for example, part of any eventual fine).¹⁰⁰ Large sanctions are likely to be required if these platforms are to take the regulations seriously.

97. Council Regulation 2019/1150, 2019 O.J. (L 186).

98. *See, e.g.*, Council Regulation 2022/1925, art. 6.2, 6.4, 6.7-8 2022 O.J. (L 265).

99. The regulator should exercise such power with great caution. A/B testing by its nature can make some consumers worse off than they would have been but for the test, either in an absolute sense or relative to other consumers.

100. The SEC administers such a whistleblower program to help uncover financial fraud. *Office of the Whistleblower*, SEC, <https://www.sec.gov/whistleblower> [<https://perma.cc/SEY5-RTGF>].

V. Conclusion

If markets are to function efficiently and in the interest of businesses and consumers, there must be an authority empowered to enforce an effective regime of consumer-protection rules applicable to those markets. This is the case for online markets just as it is for offline markets. In addition to this efficiency-based justification for consumer protection, we also know that consumers have the right not to be defrauded or misled. Consumer-protection law ought to protect that right regardless of whether the consumer is transacting online or offline. Despite these points of consensus—that consumer protection is necessary to promote efficiency and to protect consumer rights online—too little has been done to ensure that the various standards applicable in *offline* markets are sufficient or adequate to guarantee efficiency and fairness in *online* markets.

This Article has outlined eleven key features of online markets that might necessitate standards additional to or different from those that are applicable offline. In online markets, for example, consumers generally do not interact face-to-face with sellers. This suggests that online sellers should be required to disclose more information about themselves (location and contact information, for example) than offline sellers. Similarly, online consumers generally are unable physically to evaluate products before purchase. This suggests that online quality indicators (product reviews and ratings, for example) take on heightened importance online and ought to be policed with heightened scrutiny.

As a general matter, however, and even though this Article recommends several specific policy proposals for each key difference between online and offline markets, we do not think it necessary that every jurisdiction adopt an entirely new or separate regulatory regime for online markets. Many, if not most, of our proposals could be enacted through minor changes to existing law or regulation or through decisional law interpreting existing standards of conduct. Some have already been implemented in some jurisdictions. What *is* needed in *all* jurisdictions, however, is a regulator or regulators with sufficient expertise around technical issues such as A/B testing and algorithmic decision making that they can understand, anticipate, and remedy the myriad ways that online firms can disadvantage consumers.

We also advocate that authorities in various jurisdictions think *systematically* about how to calibrate their consumer protection regimes to ensure that they foster efficiency and protect consumer rights online. The proposals set forth in this Article provide a menu of options—all of which are supported by basic economic principles—specifically designed for authorities engaged in such an undertaking.
